

Create a Company

A **Company** enables data security by creating a domain-level isolation from other Companies or Business Units. Each company has its own Teams, Projects, Data collection, and Device management.

Create a Single Company

To create a Company:

1. Immediately after you log in, click **NEW** in the main menu under Companies.

2. Enter a unique **Company Name** and relevant **Description**.

- Company names are alphanumeric, with only the underscore (_) and period (.) special characters permitted.
- Duplicate Company names are prohibited.
- If a Company was previously deleted, a new Company with the deleted name cannot be created.

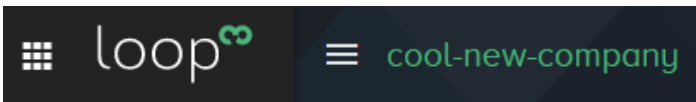

LoopCloud automatically creates the Company domain, based on the Company name.

Example

A company named **Cool New Company** will become:

`cool-new-company-litmus.pro`

The domain name displays at the top of the LoopCloud window to indicate the context for the configurations.

Find Company configurations using the navigation panel: **Settings > Company**. See also, [Configure Company Teams](#).

Create Additional Companies

In a multi-tenancy environment, you can create a Company for each of your client companies. In a large corporation, a Company can be used to represent a business unit.

To create a Company:

1. To create another Company, click the Loop icon at the top left of the window.
2. Click **NEW** and enter the **Company Name** and relevant **Description**.

- If only one Company exists in your LoopCloud environment, the login will take you directly to that Company.
- If multiple companies have been created, the login will take you to a menu of companies.
